Title: Document embedding using Transformers

Author: David Burian

Institute: Institute of Formal and Applied Linguistics

Supervisor: Jindřich, Libovický Mgr. Ph.D., Institute of Formal and Applied Linguistics

Abstract: Abstract.

Keywords: text embedding document embedding transformers document classification document similarity

Contents

Introduction

- what we are aiming to do
- why is it important/useful — where are embeddings used
- long documents — why?
- transformers — why?

1. Related Work

- what has been done
- approaches to our problem
- mention models we will use

2. Benchmarks

In this chapter we will describe a set of benchmarks, which will test our model and enable us to compare it to other models. First we will describe the tasks — datasets and corresponding evaluation metrics, then we will talk about the models. Results of the benchmarks are discussed in Chapter **??**.

2.1 Tasks

Each task aims to test a different aspect of a model. Our aim was to design a set of tasks, which can capture a model's capability to embed whole documents. The major obstacle we faced was the lack of labeled datasets with longer pieces of text (more than 512 tokens).

TODO: how did we solve the issue

TODO: complete list of task types

Classification

Classification tasks test model's capability to separate inputs based on a complex feature. In our settings, classification tasks can tell us what information the document embedding contains.

2.1.1 IMDB Sentiment Analysis

IMDB sentiment analysis task is a simple binary classification task. The dataset contains movie reviews from the Internet Movie Database[1] labaled as either positive or negative. The dataset is commonly referred to as IMDB classification or sentiment dataset Maas et al. [2011].

The dataset is split evenly to test and train set, each having 25000 reviews. The dataset also contains 50000 unlabeled reviews. The label distribution in both sets is uniform, each of of the two labels is represented by 12500 reviews.

As can be seen from the figure Figure 2.1 the reviews are quite short with only 13.56% being longer than 512 RoBERTa tokens.

We included this task to see how our model compares in realtively undemanding settings, while also evaluating its performence on shorter documents.

2.2 Models

In this section we describe a set of benchmark models our model will be compared to. All of the benchmark models are able to map a continuous piece of text to a dense vector representation. This was a requirement as the aim of the evaluation is to compare different text embeddings. Otherwise we aimed to select a variety of models with different architectures, learning algorithms and learning tasks.

2.2.1 Doc2Vec

Doc2Vec (also known as Paragraph Vector) introduced in Le and Mikolov [2014], combines slightly altered DBOW and DM architectures previously used by Word2Vec in Mikolov et al. [2013]. As seen in Figure 2.2 Doc2Vec's versions of DBOW and DM architectures, called PV-DBOW and PV-DM, incorporate paragraph's identifier. This allows the architectures to store the information about the input paragrahs, which is then used as the paragraph's embedding. The final paragrpah embedding produced by Doc2Vec is linear combination of the representations of both architectures. Note that, a paragrpah can be any piece of continuous text.

TODO: my own graphic here

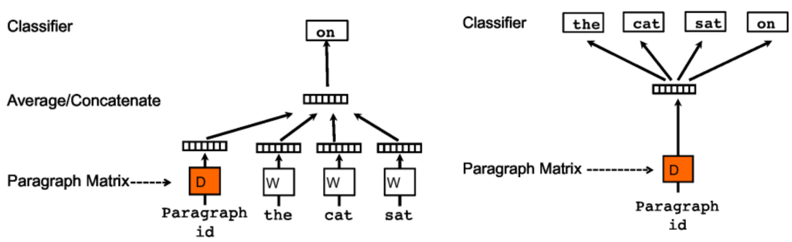

Figure 2.2: PV-DM and PV-DBOW architectures.

Doc2Vec is trained using language modelling — both architectures should predict a word which is probable in the given context. In PV-DM the context is paragraph id and the neighbouring words, in PV-DBOW the context is only the

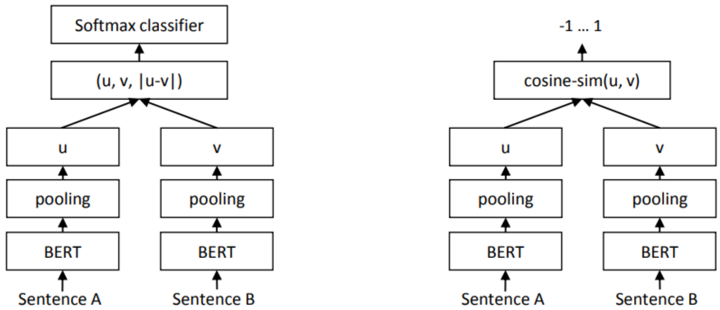

Figure 1: SBERT architecture with classification objective function, e.g., for fine-tuning on SNLI dataset. The two BERT networks have tied weights (siamese network structure).

Figure 2: SBERT architecture at inference, for example, to compute similarity scores. This architecture is also used with the regression objective function.

Figure 2.3: SBERT architecture with siamiese networks.

pragraph id.

Advantage of Doc2Vec is its small size and therefore quick learning. Also Doc2Vec is able to process paragraphs of all lengths. The disadvantage is that the embedding must be learned even during inference.

2.2.2 SBERT

Sentence-BERT (or SBERT for short) introduced in Reimers and Gurevych [2019], is a composition of a BERT-like model with pooling layer above its final hidden states. This architecture is common for sequence classification using a transformer model. SBERT differs from these simpler approaches, by finetuning on NLI datasets using siamiese networks. The training setup is depicted in Figure 2.3. After such training the STS scores of SBERT embeddings significantly increases.

The disadvantage of SBERT is its inability to process longer pieces of texts. The workaround is to either truncate the input or to average multiple embeddings produced by a sliding window over the input. Both approaches limit the model's ability to see the document as a whole, which could impair the quality of the produced embeddings.

2.2.3 Longformer

Longformer introduced in Beltagy et al. [2020], is a transformer with sparse attention matrix. Whereas in traditional transformer we see dense attention matrix — every token "attends" to every other token, in Longformer's attention every token "attends" only to selected few global tokens and neighbouring tokens. Example of such sparse attention matrix is depicted in Figure 2.4. This allows Longformer to process inputs in linear time of the input length. Thus Longformer is able to process inputs up to 4096 tokens long.

TODO: maybe comparison to normal dense attention

While sparse attention matrix allows Longformer to process longer texts, it also limits its computational power. Zaheer et al. [2020] show that with sparse

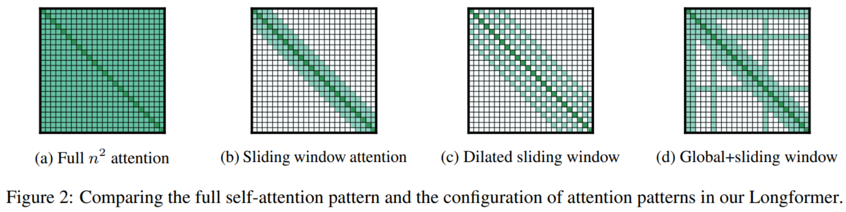

Figure 2.4: Longformer attention matrix.

attention we need more layers to match the power of a dense attention matrix.

To produce input embeddings we average the embeddings of last hidden states.

TODO: training

2.2.4 BigBird

TODO: how is it different from longformer

3. My model

- what models I have tried
- training ideas

4. Evaluation

- tabulated experiment results
- discussion

Conclusion

- what i have done — what are the model's results
- other findings
